November 2026

Dear Hiring Team,

I am a Senior Data Engineer with more than five years of experience turning fragmented operational data into pipelines, models and decision tools that people trust. I am looking for a data engineering role where reliable data and clear communication matter as much as the technology.

Today I am responsible for the analytics layer of Magalu Group's Information Security Governance, hired through ViwSec. I started with a data diagnostic across thirteen teams and turned it into a multi-year portfolio of data initiatives. The first deliveries are already in production, including a role-based platform that recalculates security-control performance for twelve business units every morning without ever writing to the source systems.

Before that, at MagaluPay, I built the fintech's security analytics layer on Google Cloud (Cloud Functions, Pub/Sub, BigQuery) and a vulnerability target model validated against an independent implementation, with zero discrepancies across more than 10,000 cells. At Experian, I led machine-learning work in fraud prevention: anomaly detection for Pix instant payments and real-time authentication and credit-risk scores running in production under Central Bank rules. At Dasa, I ran an OKR framework for more than 50,000 employees and built a nationwide arbovirus monitoring solution.

In every role I work the same way: sources stay read-only, every total reconciles to its origin, recurring work is automated, and every chart states its conclusion for people who are not data specialists. My background in Biomedical Engineering and my ongoing postgraduate studies in Machine Learning Engineering give me both rigour in measurement and depth in modelling.

My portfolio at crovim.github.io shows ten of these cases with interactive demos. I would welcome a conversation about how I could contribute to your team.

Sincerely,
Clovis Junior
